PROTECT MORE DOGS THAN EVER BEFORE
with effective and affordable IVERHART® Brand products.

IVERHART MAX® (ivermectin/pyrantel pamoate/praziquantel) Chewable Tablets prevent heartworm disease and treat and control hookworms, roundworms, and even tapeworms at a value that your clients will appreciate.

Heartworms  Hookworms  Roundworms  Tapeworms

IVERHART MAX Chewable Tablets offer:
• Proven active ingredients used by veterinarians for years
• A more cost-effective option than comparable heartworm preventives that do not control tapeworms¹
• Four convenient tablet sizes including an option for toy breeds
• A satisfaction guarantee that you and your clients can be confident in

ALSO AVAILABLE:
IVERHART PLUS® (ivermectin/pyrantel) Flavored Chewables. Offer your clients effective protection against heartworms, roundworms, and hookworms at an excellent value.

IVERHART MAX® Chewable Tablets
IVERHART PLUS® Flavored Chewables

Virgin
Passionate about animal health
**IVERHART MAX® Chewable Tablets**

(*ivermectin/pyrantel pamoate/praziquantel*)

For oral use in dogs only.

**Caution:** Federal (U.S.A.) law restricts this drug to use by or on the order of a licensed veterinarian.

**Description:** IVERHART MAX® Chewable Tablets are a combination of three anthelmintics (*ivermectin*/pyrantel pamoate/praziquantel). The tablets are available in four sizes in color-coded packages for oral administration to dogs according to their weight (see Dosage).

**Indications:** For use in dogs to prevent canine heartworm disease by eliminating the tissue stage of heartworm larvae (*Dirofilaria immitis*) for a month (30 days) after infection and for the treatment and control of roundworms (*Toxocara canis*, *Toxocara leonina*), hookworms (*Angiostrongylus caninum*, *Uncinia stenocephala*, *Ancylostoma braziliense*), and tapeworms (*Dipylidium caninum*, *Taenia platyorma*).

**Dosage:** IVERHART MAX (ivermectin/pyrantel pamoate/praziquantel) Chewable Tablets should be administered orally at monthly intervals at the recommended minimum dose level of 6 mg/kg of *ivermectin* per kilogram (2.72 mg/lb), 5 mg of *pyrantel* (as pamoate salt) per kg (2.27 mg/lb) and 5 mg of *praziquantel* per kg (2.27 mg/lb) of body weight, as follows:

IVERHART MAX Chewable Tablets are recommended for dogs 8 weeks of age and older. For dogs over 100 lbs, use the appropriate combination of these Chewable Tablets.

**Administration:** Remove only one tablet at a time from the foil-backed blister card. Return the remaining tablets to their box to protect the product from light. IVERHART MAX Chewable Tablets can be offered to the dog by hand or be added intact to a small amount of dog food. Care should be taken that the dog consumes the complete dose, and the dog should be observed for a few minutes after administration to ensure that part of the dose is not lost or rejected. If it is suspected that any of the dose has been lost, redosing is recommended.

IVERHART MAX Chewable Tablets should be given at monthly intervals during the period of the year when mosquitoes (vectors), potentially carrying infective heartworm larvae, are active. The initial dose must be given within a month (30 days) after the dog’s first exposure to mosquitoes. The final dose must be given within a month (30 days) after the dog’s last exposure to mosquitoes.

When replacing another heartworm preventive product in a heartworm disease prevention program, the first dose of IVERHART MAX Chewable Tablets must be given within a month (30 days) of the last dose of the former medication. A heartworm test should be performed prior to switching heartworm preventive products.

If the interval between doses exceeds a month (30 days), the efficacy of *ivermectin* can be reduced. Therefore, for optimal performance, the tablet must be given once a month or about the same day of the month. If treatment is delayed, whether by a few days or many, immediate treatment with IVERHART MAX Chewable Tablets and resumption of the recommended dosing regimen will minimize the opportunity for the development of adult heartworms.

**WARNING:** For use in dogs only. Keep this and all drugs out of reach of children. In safety studies, testicular hypoplasia was observed in some dogs receiving 3 and 5 times the maximum recommended dose monthly for 6 months (see Animal Safety).

In case of ingestion by humans, clients should be advised to contact a physician immediately. Physicians may consult a Poison Control Center for advice concerning cases of ingestion by humans.

For a copy of the Material Safety Data Sheet (MSDS), or to report adverse reactions, call 1-800-338-3658.

**Precautions:** Use with caution in sick, debilitated, or underweight animals and dogs weighing less than 10 lbs (see Animal Safety). The safety of the drug has not been evaluated in pregnant or lactating bitches.

All dogs should be tested for existing heartworm infection before starting treatment with IVERHART MAX Chewable Tablets, which are not effective against adult *D. immitis*. Infected dogs should be treated to remove adult heartworms and microfilariae before initiating a heartworm prevention program.

While some microfilariae may be killed by the *heartworm* in IVERHART MAX Chewable Tablets at the recommended dose level, IVERHART MAX Chewable Tablets are not effective for microfilariae clearance.

A mild hypersensitivity-type reaction, presumably due to dead or dying microfilariae and particularly involving a transient diarrhea, has been observed in clinical trials with *heartworm* alone after treatment of some dogs that have circulating microfilariae.

**Adverse Reactions:** Self-limiting adverse reactions including lethargy, Impression, salivation, shivering, diarrhea, decreased appetite, licking, and biting were reported between 20 minutes and 72 hours following treatment in a field study with IVERHART MAX Chewable Tablets.

In clinical field trials with *ivermectin/pyrantel pamoate, vomiting* or diarrhea within 24 hours of dosing was observed (1.1% of administered doses). The following adverse reactions have been reported following the use of *ivermectin* depression/lethargy, vomiting, anorexia, diarrhea, mydriasis, ataxia, staggering, convulsions and hyperactivity.

**Effectiveness:** IVERHART MAX Chewable Tablets, given orally using the recommended dose and regimen, are effective against the tissue stage of *D. immitis* for a month (30 days) after infection and, as a result, prevent the development of the adult stage. IVERHART MAX Chewable Tablets are also effective against canine roundworms (*T. canis*, *T. leonina*), hookworms (*A. caninum*, *U. stenocephala*, *A. braziliense*), and tapeworms (*T. platyorma*, *D. caninum*). A total of 61 dogs and puppies with naturally acquired or experimental parasite infections treated with IVERHART MAX Chewable Tablets were enrolled in 7 well-controlled laboratory studies to establish effectiveness. These studies included dogs of various sizes, ages and breeds. Data from these studies demonstrated IVERHART MAX Chewable Tablets are safe and effective for the removal of the parasite species indicated on the label when used as directed.

**Animal Safety:** Studies with *heartworm* indicate that certain dogs of the Collie breed are more sensitive to the effects of *heartworm* administration at elevated dose levels (more than 16 times the target use level) of 6 mg/kg than dogs of other breeds. At elevated doses, sensitive dogs showed adverse reactions which included mydriasis, depression, ataxia, tremors, drooling, paresthesia, recumbency, excretability, stupor, coma and death. No signs of toxicity were seen at 10 times the recommended dose (27.2 mg/lb) in sensitive Collies. Results of these studies and bioequivalence studies support the safety of *praziquantel*-products in dogs, including Collies, when used as recommended by the label.

In a target animal safety study, IVERHART MAX Chewable Tablets were administered to 5-week-old Beagle puppies at one, three and five times the maximum recommended dose of 12.5 mg/kg *ivermectin*, 10.47 mg/kg *pyrantel* and 10.47 mg/kg *praziquantel*. The dogs were treated every 30 days for 6 months. Vomiting within 6 hours of dosing and soft or watery feces within 24 hours of dosing were observed. Other observations during the study were: anorectal swelling, lethargy, head movements, slow, abrupt or difficult breathing, and salivation. One dog in the 5x group had tremors and decreased activity. All signs were transient. No treatment was required. Pathology showed testicular hypoplasia in the 3 and 5x groups (see Warnings).

In a laboratory safety study, 12-week-old Beagle puppies receiving 3 and 5 times the recommended dose once weekly for 13 weeks demonstrated a dose-related decrease in testicular maturation compared to controls. This study, all treated puppies had significantly higher cholesterol levels compared to untreated controls.

In a reproductive safety study, adult males were treated at 37.5 mg/kg *ivermectin*, 31.4 mg/kg *pyrantel* and 31.4 mg/kg *praziquantel* every 14 days during two full spermatogenic cycles (112 days). The quality of semen and reproductive health were not affected by treatment. Treatment-related vomiting and soft feces were reported during this study.

In a study of the effectiveness of IVERHART MAX Chewable Tablets for treatment of *T. canis* one 8.1 lb, 72-day-old puppy died 6 days after administration of IVERHART MAX Chewable Tablets at the label dose. This puppy and many of the other puppies in the study had high worm burdens and were reported to have diarrhea, sometimes bloody, frequently before and after treatment with IVERHART MAX Chewable Tablets or the placebo. Dehydration and signs of anemia (pale mucous membranes) were the only abnormal gross necropsy findings observed. No definitive cause of death was determined. In a 90-day field study, the most serious ADIs (lethargy, Impression, and salivation) were seen in dogs weighing less than 10 lbs (see Precautions).

**How Supplied:** IVERHART MAX Chewable Tablets are available in four dosage strengths (see Dosage sections) for dogs of different weights. Each strength comes in a box of 6 chewable tablets, packed 10 boxes per display box.

FDA 141-257. Approved by FDA.

IVERHART PLUS®
(ivermectin/pyrantel)
Flavored Chewables

Caution: Federal (U.S.A.) law restricts this drug to use by or on the order of a licensed veterinarian.

INDICATIONS: For use in dogs to prevent canine heartworm disease by eliminating the tissue stage of heartworm larvae (Dirofilaria immitis) for a month (30 days) after infection and for the treatment and control of ascards (Toxocara canis, Toxascaris leonina) and hookworms (Ancylostoma caninum, Uncinaria stenocephala, Ancylostoma braziliense).

DOSEAGE: IVERHART PLUS® (ivermectin/pyrantel) Flavored Chewables should be administered orally at monthly intervals at the recommended minimum dose level of 6 mcg of ivermectin per kilogram (2.72 mcg/lb) and 5 mg of pyrantel (as pyrantel salt) per kg (2.27 mg/lb) of body weight. The recommended dosing schedule for prevention of canine heartworm disease and for the treatment and control of ascards and hookworms is as follows:

<table>
<thead>
<tr>
<th>Dog Weight</th>
<th>Flavored Chewable</th>
<th>Ivermectin Content</th>
<th>Pyrantel Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 25 lb</td>
<td>1</td>
<td>68 mcg</td>
<td>57 mg</td>
</tr>
<tr>
<td>26 to 50 lb</td>
<td>1</td>
<td>136 mcg</td>
<td>114 mg</td>
</tr>
<tr>
<td>51 to 100 lb</td>
<td>1</td>
<td>272 mcg</td>
<td>227 mg</td>
</tr>
</tbody>
</table>

IVERHART PLUS Flavored Chewables are recommended for dogs 6 weeks of age and older. For dogs over 100 lbs use the appropriate combination of these flavored chewables.

ADMINISTRATION: Remove only one flavored chewable at a time from the foil-backed blister card. Because most dogs find IVERHART PLUS Flavored Chewables palatable, the product can be offered to the dog by hand. Alternatively, it may be added intact to a small amount of dog food or placed in the back of the dog’s mouth for forced swallowing.

Care should be taken that the dog consumes the complete dose, and treated animals should be observed for a few minutes after administration to ensure that part of the dose is not lost or rejected. If it is suspected that any of the dose has been lost, redosing is recommended.

IVERHART PLUS Flavored Chewables should be given at monthly intervals during the period of the year when mosquitoes (vector), potentially carrying infective heartworm larvae, are active. The initial dose must be given within a month (30 days) after the dog’s first exposure to mosquitoes. The final dose must be given within a month (30 days) after the dog’s last exposure to mosquitoes.

When replacing another heartworm preventive product in a heartworm disease preventive program, the first dose of IVERHART PLUS Flavored Chewables must be given within a month (30 days) of the last dose of the former medication.

If the interval between doses exceeds a month (30 days), the efficacy of ivermectin can be reduced. Therefore, for optimal performance, the flavored chewable must be given once a month on or about the same day of the month. If treatment is delayed, whether by a few days or many, immediate treatment with IVERHART PLUS Flavored Chewables and resumption of the recommended dosing regimen minimizes the opportunity for the development of adult heartworms. Monthly treatment with IVERHART PLUS Flavored Chewables also provides effective treatment and control of ascards (T. canis, T. leonini) and hookworms (A. caninum, O. vulpis, O. viverrini, H. diminuta, A. braziliense).

EFFICACY: IVERHART PLUS Flavored Chewables, given orally using the recommended dose and regimen, are effective against the tissue larval stage of D. immitis for a month (30 days) after infection and, as a result, prevent the development of the adult stage. IVERHART PLUS Flavored Chewables are also effective against canine ascards (T. canis, T. leonini) and hookworms (A. caninum, O. vulpis, O. viverrini, H. diminuta, A. braziliense).

ACCEPTABILITY: In a trial in client-owned dogs, IVERHART PLUS Flavored Chewables were shown to be a palatable oral dosage form consumed at first offering by the majority of dogs.

PRECAUTIONS: All dogs should be tested for existing heartworm infection before starting treatment with IVERHART PLUS Flavored Chewables, which are not effective against adult D. immitis. Infected dogs must be treated to remove adult heartworms and microfilariae before initiating a program with IVERHART PLUS Flavored Chewables.

While some microfilariae may be killed by the ivermectin in IVERHART PLUS Flavored Chewables at the recommended dose level, IVERHART PLUS Flavored Chewables are not effective for microfilariae clearance. A mild hypersensitivity-type reaction, presumably due to death or dying microfilariae and particularly involving a transient diarrhea, has been observed in clinical trials with ivermectin alone after treatment of some dogs that have circulating microfilariae.

Keep this and all drugs out of the reach of children. In case of ingestion by humans, clients should be advised to contact a physician immediately. Physicians may contact a Poison Control Center for advice concerning cases of ingestion by humans.

Protect product from light.

Warnings: Use product on or before its expiration date. Discard or return unused tablets.

ADVERSE REACTIONS: In clinical trials with ivermectin/pyrantel, vomiting or diarrhea within 24 hours of dosing was rarely observed (1.1% of administered doses). The following adverse reactions have been reported following the use of ivermectin: Depression/lethargy, vomiting, anorexia, diarrhea, ataxia, staggering, convulsions and hypersalivation.

SAFETY: Studies with ivermectin indicate that certain dogs of the Collie breed are more sensitive to the effects of ivermectin administered at elevated dose levels (more than 10 times the target use level of 6 mcg/kg) than dogs of other breeds. At elevated doses, sensitive dogs showed adverse reactions which included mydriasis, depression, ataxia, tremors, drooling, paresis, recumbency, excitability, stupor, coma and death. Ivermectin demonstrated no signs of toxicity at 10 times the recommended dose (60 mcg/kg) in sensitive Collies. Results of these trials and bioequivalence studies, support the safety of ivermectin products in dogs, including Collies, when used as recommended.

Ivermectin/pyrantel has shown a wide margin of safety at the recommended dose level in dogs, including pregnant or breeding bitches, stud dogs and puppies aged 6 or more weeks. In clinical trials, many commonly used flea collars, dips, shampoos, anthelmintics, antibiotics, vaccines and steroid preparations have been administered with ivermectin/pyrantel in a heartworm disease preventive program.

In one trial, where some pups had parvo virus, there was a marginal reduction in efficacy against intestinal nematodes, possibly due to a change in intestinal transit time.

HOW SUPPLIED: IVERHART PLUS Flavored Chewables are available in three dosage strengths (See Dosage section) for dogs of different weights. Each strength comes in a box of 6 tablets, packed 10 boxes per display box.

ANADA 200-302, Approved by FDA.
